

## SMART CONTRACT AUDIT

May 22th 2023 | v. 1.0

# Security Audit Score

**PASS**

Zokyo Security has concluded that this smart contract passes security qualifications to be listed on digital asset exchanges.

# TECHNICAL SUMMARY

This document outlines the overall security of the LFi smart contracts evaluated by the Zokyo Security team.

The scope of this audit was to analyze and document the LFi smart contracts codebase for quality, security, and correctness.

## Contract Status

There were 0 critical issues found during the audit. (See [Complete Analysis](#))

It should be noted that this audit is not an endorsement of the reliability or effectiveness of the contracts but rather limited to an assessment of the logic and implementation. In order to ensure a secure contract that can withstand the Ethereum network's fast-paced and rapidly changing environment, we recommend that the LFi team put in place a bug bounty program to encourage further active analysis of the smart contracts.

# AUDITING STRATEGY AND TECHNIQUES APPLIED

The source code of the smart contract was taken from the LFi repository and Etherscan link:

Repository:

ETHEREUM MAINNET:

LFi: <https://etherscan.io/address/0xcd07c2d04b8551ff38a9c1e67dc7c3f16bfc9400#code>

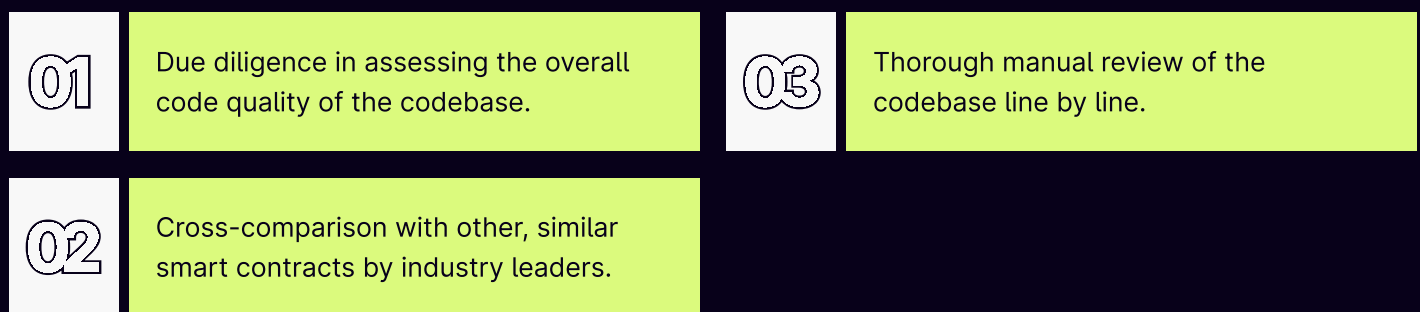

Within the scope of this audit, the team of auditors reviewed the following contract(s):

- LFI.sol
- LFI Proxy

**During the audit, Zokyo Security ensured that the contract:**

- Implements and adheres to the existing standards appropriately and effectively;
- The documentation and code comments match the logic and behavior;
- Distributes tokens in a manner that matches calculations;
- Follows best practices, efficiently using resources without unnecessary waste;
- Uses methods safe from reentrance attacks;
- Is not affected by the most recent vulnerabilities;
- Meets best practices in code readability, etc.

Zokyo Security has followed best practices and industry-standard techniques to verify the implementation of LFi smart contracts. To do so, the code was reviewed line by line by our smart contract developers, who documented even minor issues as they were discovered. In summary, our strategies consist largely of manual collaboration between multiple team members at each stage of the review:

# Executive Summary

There was no critical issue found during the audit alongside one with medium severity and some of low severity and one informational issue. All the mentioned findings may have an effect only in case of specific conditions performed by the contract owner and the investors interacting with it. They are described in detail in the “Complete Analysis” section. Contracts are already deployed.

# STRUCTURE AND ORGANIZATION OF THE DOCUMENT

For the ease of navigation, the following sections are arranged from the most to the least critical ones. Issues are tagged as “Resolved” or “Unresolved” depending on whether they have been fixed or addressed. The issues that are tagged as “Verified” contain unclear or suspicious functionality that either needs explanation from the Client or remains disregarded by the Client. Furthermore, the severity of each issue is written as assessed by the risk of exploitation or other unexpected or otherwise unsafe behavior:

 **Critical**

The issue affects the contract in such a way that funds may be lost, allocated incorrectly, or otherwise result in a significant loss.

 **High**

The issue affects the ability of the contract to compile or operate in a significant way.

 **Medium**

The issue affects the ability of the contract to operate in a way that doesn't significantly hinder its behavior.

 **Low**

The issue has minimal impact on the contract's ability to operate.

 **Informational**

The issue has no impact on the contract's ability to operate.

# COMPLETE ANALYSIS

## FINDINGS SUMMARY

#	Title	Risk	Status
1	Mismatch between deployed code and code given for an audit	Medium	Resolved
2	Unlocked compiler version	Low	Resolved
3	Renounce Ownership	Low	Acknowledged
4	Transfer Ownership	Low	Acknowledged
5	Centralization risk and token upgradeability	Low	Acknowledged
6	Use safe upgradeable mechanism	Informational	Acknowledged

### Mismatch between deployed code and code given for an audit

The code for LFI token given for the audit is different from the code given deployed on the testnets by the team.

**Recommendation:**

It is advised to thoroughly check the code and deploy only the code that is audited. Otherwise, it could result in unaudited code being deployed on mainnet which can result in bugs.

**Comment:** The client provided verified contracts deployed on the Ethereum mainnet and the team checked to ensure that the audited code matched with the code deployed.

### Unlocked compiler version

The compiler version used in the LFI token contract is ^0.8.18 which is a floating compiler version. Using a floating compiler version can result in code being tested on a specific version of the compiler and being deployed via a different compiler version. This is not recommended as it could introduce bugs.

**Recommendation:**

It is advised to fix the compiler version for each of the custom contracts (other than standard contracts like Openzeppelin) to avoid this issue.

## Renounce Ownership

The renounceOwnership function can be called accidentally by the admin leading to the immediate renouncement of ownership to zero address after which any onlyOwner functions will not be callable which can be risky.

### Recommendation:

It is advised that the Owner cannot call renounceOwnership without first transferring ownership to a different address. Additionally, if a multi-signature wallet is utilized, executing the renounceOwnership method for two or more users should be confirmed. Alternatively, the Renounce Ownership functionality can be disabled by overriding it.

Refer to this post for additional info- [https://www.linkedin.com/posts/razzor\\_github-razzorseccrazzorsec-contracts-activity-6873251560864968705-HOS8](https://www.linkedin.com/posts/razzor_github-razzorseccrazzorsec-contracts-activity-6873251560864968705-HOS8)

## Transfer Ownership

The `transferOwnership()` function in the contract allows the current admin to transfer his privileges to another address. However, inside `transferOwnership()`, the `newOwner` is directly stored into the storage owner, after validating the `newOwner` is a non-zero address, and immediately overwrites the current owner. This can lead to cases where the admin has transferred ownership to an incorrect address and wants to revoke the transfer of ownership or in the cases where the current admin comes to know that the new admin has lost access to his account.

### Recommendation:

It is advised to make ownership transfer a two-step process.

Refer- <https://github.com/OpenZeppelin/openzeppelin-contracts/blob/master/contracts/access/Ownable2Step.sol>  
and <https://github.com/razzorsec/RazorSec-Contracts/blob/main/AccessControl/SafeOwn.sol>

### Centralization risk and token upgradeability

An upgradeable token is not recommended as it is prone to centralization risk and contradicts the notion of the immutability of smart contracts on the blockchain. Upgrade to a malicious implementation can be detrimental as it can result in minting of numerous tokens by a malicious admin. This can result in a loss of value of funds of token holders or potential rug pulls.

#### Recommendation:

It is advised to use an upgradeable pattern for your smart contracts only if it is really necessary and cannot be done without. Additionally, it is advised to use a multisig for the owner of upgradeable contracts if possible in order to reduce centralization risks.

### Use safe upgradeable mechanism

Using upgradeable proxies correctly and securely is a difficult task that requires deep knowledge of the proxy pattern (refer [this](#)). Incorrectly upgrading the contracts can lead to security issues.

#### Recommendation:

It is advised to use Openzeppelin plugins in Hardhat or Truffle (refer <https://docs.openzeppelin.com/upgrades-plugins/1.x/> ) to upgrade your contracts.

	LFI	LFI Proxy
Re-entrancy	Pass	Pass

We are grateful for the opportunity to work with the LFi team.

**The statements made in this document should not be interpreted as an investment or legal advice, nor should its authors be held accountable for the decisions made based on them.**

Zokyo Security recommends the LFi team put in place a bug bounty program to encourage further analysis of the smart contract by third parties.
